# Manicaland Centre for Public Health Research Epidemic Status Report 2014 

## INTRODUCTION

The baseline survey (round 1) for the Manicaland HIV/STD Prevention Project was carried out from July 1998 to January 2000. Follow-up surveys were conducted from July 2001 to January 2003 (round 2), August 2003 to August 2005 (round 3), August 2006 to November 2008 (round 4), July 2009 to July 2011 (round 5) and finally Round 6 from July 2012 to November 2013 (round 6). This sheet compares the main results on local patterns of HIV infection, experience of other sexually transmitted diseases (STDs), knowledge and awareness of HIV and other STDs, and sexual and health seeking behaviour including HIV testing and treatment in rounds 4,5 and 6 . For rounds 5 and 6 , results are also shown for children aged 2-17 years. The following is a brief summary of the main findings; further details are given overleaf.

## AREAS COVERED

The survey covered the following areas in Mutasa, Eastern Highlands, Bonda, Honde, Selbourne, and Watsomba. In round 4, 5 and 6: 5,595, 5,833 and 4,969 adults participated, respectively. In round 5 and 6: 1538 and 1272 children participated respectively. The numbers of adults fluctuated between rounds due to migration, changes in survey eligibility criteria and other factors.

## KEY RESULTS

- $11.7 \%$ of men and $15.6 \%$ of women are currently infected with HIV.
- $2.1 \%$ of boys and $1.9 \%$ of girls aged 2-14 years are currently infected with HIV.
- HIV prevalence for men and women has declined steadily over the past 8 years. However, prevalence is still at a high level.
- The number of women who acquired one or more new partner(s) within one year has declined steadily whilst that of men remained fairly constant.
- Stigma associated with HIV/AIDS is decreasing and most people are willing to look after a relative who has AIDS. More people are willing to disclose their status to parents compared to spouse/partner.
- The proportion of adults having an HIV test has increased substantially over the last 5 years. However, fewer men, $58 \%$ than women, $80 \%$ have ever had an HIV test.
- There was a significant increase in the uptake of ART for men ( $21 \%$ to $39 \%$ ) and women ( $29 \%$ to $44 \%$ ) in the past 7 years. However $61 \%$ of HIV+ men are not on ART
- Only $17 \%$ of boys and $16 \%$ of girls aged between 2 to 14 were found to have been tested for HIV in their lifetime.
